The *N*-body problem consists in study the motion of *N* pointlike masses, interacting among themselves through no other forces than their mutual gravitational attraction according to Newton's gravitational law.

The equations of motion are

$$m_k \mathbf{r}''_k = \sum_{j=1, j\neq i}^n \frac{Gm_j m_k}{r_{jk}^3} (\mathbf{r}_j - \mathbf{r}_k),$$

for  $k = 1, \ldots, N$ . Here,

#### Inertial barycentric system

The center of mass of the system satisfies

$$\frac{\sum_{k=1}^{N} m_k \mathbf{r}_k}{m_1 + \ldots + m_N} = \mathbf{a}t + \mathbf{b},$$

where **a** and **b** are constant vectors.

A (1) × (2) × (3)

#### Inertial barycentric system

The center of mass of the system satisfies

$$\frac{\sum_{k=1}^{N}m_{k}\mathbf{r}_{k}}{m_{1}+\ldots+m_{N}}=\mathbf{a}t+\mathbf{b},$$

where **a** and **b** are constant vectors.

We can consider that the center of mass is at the origin of the inertial system; i.e.

$$\sum_{k=1}^N m_k \mathbf{r}_k = \mathbf{0}.$$

## Inertial barycentric system

The center of mass of the system satisfies

$$\frac{\sum_{k=1}^{N}m_{k}\mathbf{r}_{k}}{m_{1}+\ldots+m_{N}}=\mathbf{a}t+\mathbf{b},$$

where **a** and **b** are constant vectors.

We can consider that the center of mass is at the origin of the inertial system; i.e.

$$\sum_{k=1}^N m_k \mathbf{r}_k = \mathbf{0}.$$

A such inertial system is called inertial barycentric system. In the rest of the talk we will work in an inertial barycentric system. Since the general solution of the N-body problem cannot be given, great importance has been attached from the very beginning to the search for particular solutions where the N mass points fulfilled certain initial conditions.

Since the general solution of the N-body problem cannot be given, great importance has been attached from the very beginning to the search for particular solutions where the N mass points fulfilled certain initial conditions.

A homographic solution of the N-body problem is a solution such that the configuration formed by the N-bodies at the instant t (with respect to an inertial barycentric system) remains similar to itself as t varies. Since the general solution of the N-body problem cannot be given, great importance has been attached from the very beginning to the search for particular solutions where the N mass points fulfilled certain initial conditions.

A homographic solution of the N-body problem is a solution such that the configuration formed by the N-bodies at the instant t (with respect to an inertial barycentric system) remains similar to itself as t varies.

Two configurations are similar if we can pass from one to the other doing a dilatation and/or a rotation.

The first three homographic solutions where found in 1767 by Euler in the 3–body problem. For these three solutions the configuration of the 3 bodies is collinear.

< 同 > < 回 > < 回 > <

The first three homographic solutions where found in 1767 by Euler in the 3–body problem. For these three solutions the configuration of the 3 bodies is collinear.

In 1772 Lagrange found two additional homographic solutions in the 3–body problem. Now, the configuration formed by the 3 bodies is an equilateral triangle.

At a given instant  $t = t_0$  the configuration of the *N*-bodies is central if the gravitational acceleration  $\mathbf{r}''_k$  acting on every mass point  $m_k$  is proportional with the same constant of proportionality to its position  $\mathbf{r}_k$  (referred to an inertial barycentric system); i.e.

$$\mathbf{r}''_{k} = \sum_{j=1, j \neq k}^{n} \frac{Gm_{j}}{r_{jk}^{3}} (\mathbf{r}_{j} - \mathbf{r}_{k}) = \lambda \mathbf{r}_{k}, \quad \text{for } k = 1, \dots, N.$$

At a given instant  $t = t_0$  the configuration of the *N*-bodies is central if the gravitational acceleration  $\mathbf{r}''_k$  acting on every mass point  $m_k$  is proportional with the same constant of proportionality to its position  $\mathbf{r}_k$  (referred to an inertial barycentric system); i.e.

$$\mathbf{r}''_{k} = \sum_{j=1, j \neq k}^{n} \frac{Gm_{j}}{r_{jk}^{3}} (\mathbf{r}_{j} - \mathbf{r}_{k}) = \lambda \mathbf{r}_{k}, \quad \text{ for } k = 1, \dots, N.$$

Laplace Theorem: The configuration of the *N* bodies in a homographic solution is central at any instant of time.

< 同 > < 回 > < 回 > <

At a given instant  $t = t_0$  the configuration of the *N*-bodies is central if the gravitational acceleration  $\mathbf{r}''_k$  acting on every mass point  $m_k$  is proportional with the same constant of proportionality to its position  $\mathbf{r}_k$  (referred to an inertial barycentric system); i.e.

$$\mathbf{r}''_{k} = \sum_{j=1, j \neq k}^{n} \frac{Gm_{j}}{r_{jk}^{3}} (\mathbf{r}_{j} - \mathbf{r}_{k}) = \lambda \mathbf{r}_{k}, \quad \text{ for } k = 1, \dots, N.$$

Laplace Theorem: The configuration of the *N* bodies in a homographic solution is central at any instant of time.

It is important to note that homographic solutions with rotation and eventually with a dilatation only exist for planar central configurations.

(4月) (1日) (日)

At a given instant  $t = t_0$  the configuration of the *N*-bodies is central if the gravitational acceleration  $\mathbf{r}''_k$  acting on every mass point  $m_k$  is proportional with the same constant of proportionality to its position  $\mathbf{r}_k$  (referred to an inertial barycentric system); i.e.

$$\mathbf{r}''_{k} = \sum_{j=1, j \neq k}^{n} \frac{Gm_{j}}{r_{jk}^{3}} (\mathbf{r}_{j} - \mathbf{r}_{k}) = \lambda \mathbf{r}_{k}, \quad \text{ for } k = 1, \dots, N.$$

Laplace Theorem: The configuration of the *N* bodies in a homographic solution is central at any instant of time.

It is important to note that homographic solutions with rotation and eventually with a dilatation only exist for planar central configurations.

For spatial central configurations all the homographic solutions only have a dilation.

# Where appear the central configurations (I)

Central configurations of the *N*–body problem are important because:

• (1) • (1) • (1)

# Where appear the central configurations (I)

Central configurations of the *N*–body problem are important because:

(1) They allow to compute all the homographic solutions.

Central configurations of the *N*–body problem are important because:

(1) They allow to compute all the homographic solutions.

(2) If the N bodies are going to a simultaneous collision, then the particles tend to a central configuration.

Central configurations of the *N*–body problem are important because:

(1) They allow to compute all the homographic solutions.

(2) If the *N* bodies are going to a simultaneous collision, then the particles tend to a central configuration.

(3) If the *N* bodies are going simultaneously at infinity in parabolic motion (i.e. the radial velocity of each particle tends to zero as the particle tends to infinity), then the particles tend to a central configuration.

(日)

(4) There is a relation between central configurations and the bifurcations of the hypersurfaces of constant energy and angular momentum.

(4) There is a relation between central configurations and the bifurcations of the hypersurfaces of constant energy and angular momentum.

(5) Central configurations provides good places for the observation in the solar system, for instance, SOHO project.

(4) There is a relation between central configurations and the bifurcations of the hypersurfaces of constant energy and angular momentum.

(5) Central configurations provides good places for the observation in the solar system, for instance, SOHO project.

(6) . . .

If we have a central configuration, a dilatation and a rotation (centered at the center of masses) of it, provide another central configuration.

• (1) • (1) • (1)

If we have a central configuration, a dilatation and a rotation (centered at the center of masses) of it, provide another central configuration.

We say that two central configurations are related if we can pass from one to another through a dilation and a rotation. This relation is an equivalence. If we have a central configuration, a dilatation and a rotation (centered at the center of masses) of it, provide another central configuration.

We say that two central configurations are related if we can pass from one to another through a dilation and a rotation. This relation is an equivalence.

In what follows we will talk about the classes of central configurations defined by this equivalent relation.

In 1910 Moulton characterized the number of collinear central configurations by showing that there exist exactly n!/2 classes of collinear central configurations of the *n*-body problem for a given set of positive masses, one for each possible ordering of the particles.

In 1910 Moulton characterized the number of collinear central configurations by showing that there exist exactly n!/2 classes of collinear central configurations of the *n*-body problem for a given set of positive masses, one for each possible ordering of the particles.

F.R. MOULTON, The straight line solutions of *n* bodies, Ann. of Math. **12** (1910), 1–17.

This problem is called

either central configurations of the planar 1 + n-body problem,

or central configurations of the coorbital satellite problem.

The (1 + n)-body problem was first considered by

J.C. MAXWELL, On the Stability of Motion of Saturn's Rings, Macmillan & Co., London, 1885.

< 同 > < 回 > < 回 > <

The (1 + n)-body problem was first considered by

J.C. MAXWELL, On the Stability of Motion of Saturn's Rings, Macmillan & Co., London, 1885.

In the (1 + n)-body problem the infinitesimal particles interact between them under the gravitational forces, but they do not perturb the largest mass.

Let  $\mathbf{r}(\varepsilon) = (\mathbf{r}_0(\varepsilon), \mathbf{r}_1(\varepsilon), \dots, \mathbf{r}_n(\varepsilon))$  be a planar central configuration of the *N*-body problem with N = 1 + n, associated to the masses  $m_0 = 1$  and  $m_1 = \dots = m_n = \varepsilon$ , which depend continuously on  $\varepsilon$  when  $\varepsilon \to 0$ .

Let  $\mathbf{r}(\varepsilon) = (\mathbf{r}_0(\varepsilon), \mathbf{r}_1(\varepsilon), \dots, \mathbf{r}_n(\varepsilon))$  be a planar central configuration of the *N*-body problem with N = 1 + n, associated to the masses  $m_0 = 1$  and  $m_1 = \dots = m_n = \varepsilon$ , which depend continuously on  $\varepsilon$  when  $\varepsilon \to 0$ .

We say that  $\mathbf{r} = (\mathbf{r}_0, \mathbf{r}_1, \dots, \mathbf{r}_n)$  with  $\mathbf{r}_i \neq \mathbf{r}_j$  if  $i \neq j$  and  $i, j \ge 1$ , is a central configuration of the planar (1 + n)-body problem if there exists the  $\lim_{\varepsilon \to 0} \mathbf{r}(\varepsilon)$  and this limit is equal to  $\mathbf{r}$ .

▲ 同 ▶ → 三 ▶

From this definition it is clear that if we know the central configurations of the (1 + n)-body problem, then we can continue them to sufficiently small positive values of  $\varepsilon$ .

From this definition it is clear that if we know the central configurations of the (1 + n)-body problem, then we can continue them to sufficiently small positive values of  $\varepsilon$ .

**PROPOSITION:** All central configurations of the planar (1 + n)-body problem lie on a circle  $S^1$  centered at  $\mathbf{r}_0$ .

From this definition it is clear that if we know the central configurations of the (1 + n)-body problem, then we can continue them to sufficiently small positive values of  $\varepsilon$ .

**PROPOSITION:** All central configurations of the planar (1 + n)-body problem lie on a circle  $S^1$  centered at  $\mathbf{r}_0$ .

This is the reason for which the central configurations of the (1 + n)-body problem have applications to the dynamics of the coorbital satellite systems.

### Central configurations of the coorbital satellite problem

**PROPOSITION:** Let  $\mathbf{r} = (\mathbf{r}_0, \mathbf{r}_1, \dots, \mathbf{r}_n)$  be a central configuration of the planar (1 + n)-body problem. Denoting by  $\theta_i$  the angle defined by the position of  $\mathbf{r}_i$  on the circle  $\mathbb{S}^1$ , we have

$$\sum_{j=1,j\neq k}^{n} \sin(\theta_j - \theta_k) \left[ 1 - \frac{1}{8|\sin^3(\theta_j - \theta_k)/2|} \right] = 0,$$

for k = 1, ..., n.
